ATH Creative Director Agent — PRD

Oct 12, 2026 · @Charuka

Problem and goals

ATH needs a creative director it doesn't have: an agent that owns how every open call, article, artist feature and engagement post looks, reads and sells, so the feed stops looking haywired and starts converting.

What goes wrong today

- Each open call is designed from scratch, so carousels, titles and colours change from call to call and from post to post.
- No one decides *why* a post exists (awareness, urgency, trust, entries) before it gets designed, so the copy and layout don't drive a clear action.
- Artwork gets crowded by text, effects and mixed type. The work should lead every frame.
- There's no planned feed. Posts are judged one at a time, never as a grid or a sequence.
- Performance data (reach, saves, shares, comments, entries) sits in Instagram and never feeds back into what we make next.

Goals

1. **Cohesion:** every asset is built from the ATH design system and a fixed template family, so the feed reads as one luxury editorial brand.
2. **Conversion:** every open call post has one job and one call to action, and moves people from seeing it to submitting.
3. **Shareability:** design and write for saves and shares (checklists, deadlines, prize details, artist stories), not just likes.
4. **Intelligence:** the agent pulls ATH's Instagram history and live numbers, learns what works and uses that in every brief.
5. **Leverage:** the agent acts as head of the creative team. It writes briefs, produces drafts and checks them against the brand. People approve the work and publish it.

Non-goals for v1: paid ads management, auto-publishing without human approval, and designing new logos. Logos plug in once they're final.

The agent: ATH Creative Director

The agent works as ATH's creative director and head of brand. It starts every asset from a strategy (who it's for, why it exists, what it should make people do), then turns that strategy into art direction, typography, copy and a slot in the feed.

Skills it combines

Discipline	What the agent does
Art direction	Chooses the hero image, crop and composition, and lets the artwork lead every frame
Brand and identity	Enforces the palette, type, logo use, spacing and template family. Flags anything off-brand
Typography	Sets the title hierarchy: one display line, one support line, a short CTA. No mixed fonts or effects
UI/UX	Designs swipe flow in carousels, story sequences, link-in-bio pages, ManyChat message UX and landing pages so every step is clear and easy to tap
Content strategy	Decides what to post, when and why, across professional, real, engagement and conversion content, day to day and month to month
Trends and virality	Reads Gen Z formats, hooks, sounds and memes, and adapts them so they fit a luxury editorial brand
Storytelling	Turns calls, articles and artist stories into a narrative across carousel slides and reels
Copywriting	Writes headlines, carousel text, captions, hooks, CTAs, DM scripts and hashtags in the ATH voice
Sales and marketing psychology	Matches each post to a funnel stage and a persuasion lever (aspiration, social proof, scarcity, urgency, clarity)
Funnels and lead strategy	Designs a funnel for every service, from first post to lead to sale, and segments leads into the right one
Marketing automation	Plans ManyChat keywords, flows, tags and follow-ups, and writes the copy for them
Feed planning	Plans the grid and the posting sequence across accounts so the whole network reads as one

Discipline	What the agent does
Analytics	Reads performance, comments, DMs and leads, and says what to repeat, fix or stop
Team coaching	Gives each team member clear briefs, ready-to-use prompts and the reason behind every task

What it decides vs. what people approve

- **The agent decides:** brief, template choice, layout, colour block, copy drafts, posting slot, and pass/fail on the brand check.
- **People approve:** final visuals, any claim about prizes, fees or dates, artist consent to be featured, and every publish.
- **The agent never** invents facts (prizes, jurors, deadlines), edits an artwork itself (it crops only), or posts without sign-off.

How it works with the team: the designer, the poster and the reels person each get a clear brief from the agent and send drafts back to it for review. It also keeps the open call calendar and the feed plan.

Brand inputs

The agent works from a versioned **Brand Kit** that's loaded before any task. When the brand changes (for example when the new logos land), the kit gets a new version and every template updates from it.

What goes into the kit

Input	Current state	Source
Colour palette	Burgundy #6A0620, Chilli #AA0003, Petrol #025054, Orange #DD4E28, Cocoa #4C4240, Peony #FAD2E1, Ballet #FFD6DE, Hot Rose #FFA1C2, Pistachio #D0D996, Lemon #FFF3B2, Cool Blue #B7D9FF, Sand #EAD6CB, Cream #F9ECE5, Paper #FBF6EF, Ink #2A0A12	ATH brand guide v24
Approved colour pairings	e.g. Petrol with Pistachio type, Burgundy with Peony. The full pair list needs extracting from the guide	ATH brand guide v24

Input	Current state	Source
Typography	Nord (display and statements), Proxima Nova (interface and body), Newsreader (editorial serif). Both Nord and Proxima Nova need a licence before use	ATH brand guide v24
Logos	Pending. New logos are in progress	To add once final
Rules	Gradients only on headlines. Radii 4/12/20/pill	ATH brand guide v24
Voice and tone	To write: warm, expert, artist-first, never hype	Workshop with Rabia
Photo and artwork rules	To write: crop ratios, no filters on artwork, credit format	This PRD → kit
Past best posts	Pulled automatically from Instagram (see Insights)	Instagram API

Rules the agent enforces on every asset

1. Only kit colours, only approved pairings, at most 2 brand colours plus Paper or Ink per slide.
2. At most two typefaces per asset, a fixed type scale and no outlines, shadows or warped text.
3. The artwork takes at least 60% of the frame on image-led posts. It's never covered by text and never recoloured.
4. The logo always appears in the same place at the same size, from the template.
5. Every slide has an artist credit (name, title, medium, year) whenever artwork appears.
6. One idea and one CTA per post.

Dashboard structure

The agent dashboard has one tab per content type, plus three shared views: the feed, insights and the brand.

Tab	What lives here	Main actions	Phase
Post Studio	Start any post: brief intake, reference review, proposed structure and design details	Answer the brief, upload references, generate draft, save as template	1

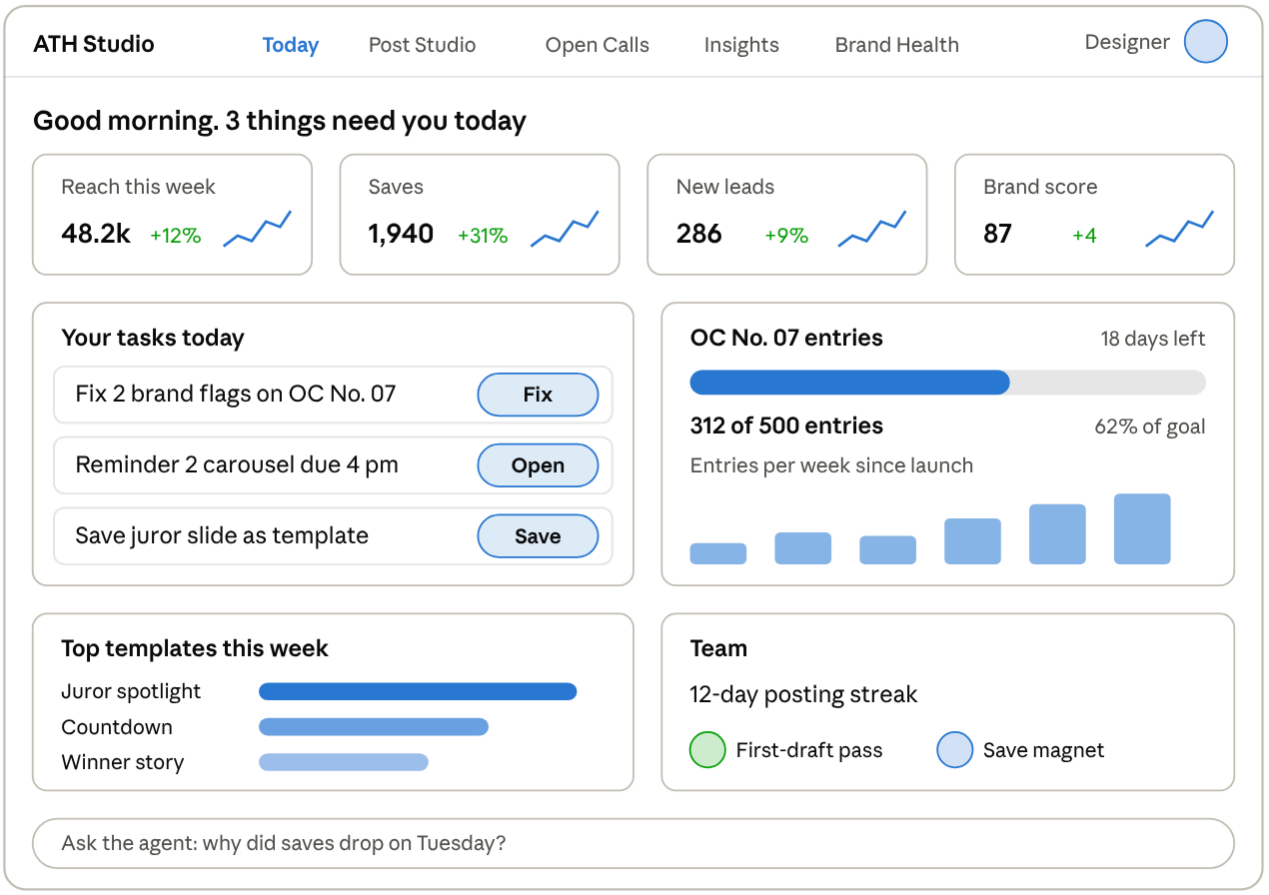

Tab	What lives here	Main actions	Phase
Open Calls	One workspace per call: brief, colour block, the full post sequence from launch to winners, entry numbers	Create call, generate sequence, review drafts, approve, schedule	1
Templates	Saved templates with versions, slots, locked rules and a performance scorecard	Reuse, refresh or retire a template	1
Feed Planner	9 to 12 week grid preview, calendar, content mix meter	Drag to reorder, check grid cohesion, fill gaps	1
Brand Health	Feed consistency score and trend, per-post brand scores, template adoption, off-brand flags	Spot drift, open the off-brand post, fix the template	1
Insights	Every post and reel with reach, saves, shares, comments, profile visits and link clicks, plus what the agent concludes from them	Ask why a post worked, compare calls, export a report	1
Brand Kit	Palette, type, logos, templates, voice and rules, all versioned	Update kit, preview templates	1
Articles	Article to carousel, quote cards and teaser reel scripts	Paste an article link, generate post set	2
Artist Features	Clean, image-led artist spotlights	Upload artwork and bio, generate feature	2
Engagement Posts	Questions, polls, prompts, community reposts, behind the scenes	Generate ideas, schedule fillers	2

Every item in every tab carries the same card: **purpose · audience · funnel stage · lever · CTA · status · scheduled slot**. The agent's reasoning is always visible, not just the output.

Dashboard experience: visual, role-based, fun to use

The dashboard should feel like a game board, not a report. Every screen leads with a picture of the numbers and one obvious next action. Text only appears when someone asks for it.

Home screen: numbers as pictures, one button per task
Wireframe of a designer's Today view · sample numbers

home screen wireframe · Today view, sample numbers

Each person lands on their own **Today** view: their numbers, their tasks with one button each, the live open call goal, and an "ask the agent" bar.

UX principles

1. **Visual first:** every number is a tile, bar, gauge or chart. Reports become a chart plus 3 bullets, and the full reasoning sits behind a "Why?" link.
2. **One card, one action:** every card ends in a clear button: Approve, Fix, Post now, Reply, Make this reel, Save as template.
3. **Five-second rule:** anyone can tell how things are going in 5 seconds. Colour shows status, and arrows show change since last week.
4. **Images over rows:** posts, templates and drafts appear as thumbnails and grid previews, not lists.
5. **Phone-ready:** approving, replying and checking numbers all work on a phone.
6. **On-brand:** the tool uses ATH's own palette, type and Paper background, so it models the brand it protects.

7. **Ask anywhere:** a chat bar on every screen. Questions get answered with a chart and a suggested action, not an essay.
8. **Coaching inline:** the agent's tips appear as small cards next to the work ("This hook runs 3 seconds; try one of these").

Visual building blocks

Component	Shows	Where
KPI tile + sparkline	Reach, saves, leads, entries, brand score vs. last week	Today, Insights
Goal bar	Entries or leads against the target for a live campaign	Today, Open Calls
Countdown ring	Days to each deadline	Open Calls, Feed Planner
Funnel chart	Reach, then clicks, then leads, then entries, with drop-off	Open Calls, Strategy
Ranked bars	Best posts, templates, hooks, accounts	Insights, Templates
Grid preview	Next 9 to 12 posts as they'll look	Feed Planner
Brand gauge + trend	Consistency score over time	Brand Health
Heatmap	Best posting times per account	Insights
Network map	All accounts at a glance, coloured by health	Insights (founder view)

Logins and roles

Everyone signs in with their work Google account. Each person has a profile, a role and a list of the accounts they can see.

Role	Sees	Can do
Founder / admin	Everything, all accounts, team activity	Final approval, Brand Kit, users and roles, settings
Designer	Post Studio, Templates, Brand Health, assigned briefs	Upload drafts, propose templates (admin approves)

Role	Sees	Can do
Poster / community	Feed Planner, scheduled posts, DM and comment queue	Schedule approved posts, reply, flag questions
Reels maker	Reel briefs, scripts, hook library, reel results	Upload reels, mark shots done
Viewer	Reports only	Comment

- **Activity log:** who created, edited, approved and posted what, and when. Avatars show on every card.
- **Notifications:** new tasks, approvals waiting, deadlines and wins, in the app and by email (WhatsApp or Slack to confirm).

Gamification: light, never gimmicky

- **Streaks:** posting consistency per account, and on-time delivery per person.
- **Badges:** First-draft pass, Zero off-brand week, Hook master (a reel that beats the watch-time average), Save magnet.
- **Team goal bars:** for example, entries for the current call. The bar fills live and celebrates when the target is hit.
- **Weekly Wrapped:** a 30-second visual recap of the team's best post, biggest win and one thing to try next week.
- **Rewards outcomes, not volume:** leaderboards rank posts and templates by results. People see their own stats privately, and the team competes against its goals, not against each other, so nobody games the numbers.

Open Calls module (Phase 1)

Each open call becomes a campaign. It gets one brief, one colour block and one template family, and the agent produces a planned sequence of posts from teaser to winners. Each post has its own job and its own persuasion lever, but it's obvious every post belongs to the same call.

1. Call brief (entered once)

Theme, eligibility, fee, prizes, jurors, key dates, entry link, hero artworks with credits, target entries, and past results for similar calls. The agent won't generate anything until the facts are complete and approved, because every date and prize in a post comes from this brief.

2. Colour block system

- Each call gets **one approved pairing** from the Brand Kit, such as Petrol + Pistachio. Every post for that call uses it, so the audience recognises the call at a glance.
- Calls running at the same time must use clearly different pairings. The Feed Planner warns you about clashes.
- The agent suggests a pairing from the call's mood (for example, prestige and legacy point to Burgundy + Peony, and fresh and emerging talent point to Petrol + Pistachio) and explains the choice. A person confirms it.
- The colour is a frame, not a fill. It goes in bands, panels and type colour, and the artwork stays untouched.

3. Title system

Every call title uses the same formula so the feed reads like an editorial series:

- **Eyebrow:** OPEN CALL · No. 07 (running number, Proxima caps)
- **Title:** the call name, 2 to 5 words, Nord
- **Status line:** Now open / 30 days left / Closes Friday / Closed / Winners
- **Footer:** logo + handle, in the fixed position

4. Post sequence

The launch post opens the call. After that, a reminder goes out every 30 days, each one on a new angle. Once the deadline is 30 days away, posts get closer together.

Stage	Timing	Job	Lever	Format	CTA
Teaser	3 to 7 days before launch	Build anticipation	Curiosity	Single image + story countdown	Turn on notifications
Launch	Day 0	Announce the call clearly	Aspiration + clarity	7 to 8 slide carousel + reel	Apply via link in bio
Monthly reminder 1	Launch + 30 days	Show what you win	Value	Carousel: prizes and exposure	Save for later
Monthly reminder 2	Launch + 60 days	Build trust	Social proof	Past winners, testimonials	Apply
Monthly reminder 3+	Every 30 days	Remove doubts	Authority + clarity	Juror spotlight, FAQ, how to apply	Apply / DM keyword
Final 30 days	Weekly	Create momentum	Social proof + urgency	Entry count, artwork previews	Apply
Final week	7 days, 72 hours and 24 hours before	Convert late deciders	Scarcity + urgency	Countdown slides, stories, story stickers	Apply today

Stage	Timing	Job	Lever	Format	CTA
Closed	Deadline + 1 day	Thank entrants, keep trust	Belonging	Single post	Follow for results
Winners	Results date	Celebrate and recruit for the next call	Social proof + aspiration	Carousel + artist features	Join next call

5. Launch carousel anatomy (template)

1. **Hook:** hero artwork, eyebrow, title, status line, colour band
2. **The invitation:** why this call exists, in 1 to 2 sentences
3. **What you get:** prizes and exposure, in 3 bullets max
4. **Who can apply:** eligibility, medium, fee
5. **Jurors:** portraits + one line each
6. **Key dates:** a clear timeline
7. **How to apply:** 3 steps
8. **Save and share:** CTA slide built to be saved

Every reminder reuses slides 1 and 8 and changes the middle to suit its job. That's what makes the sequence consistent without repeating itself.

6. Why each post exists

For every post, the agent writes a short rationale shown on the card. For example: *Reminder 2. People who saw the launch but didn't apply often doubt they're good enough. Showing three past winners with different backgrounds lowers that barrier. Success = entry link clicks and saves.*

Other content modules (Phase 2)

These use the same engine as Open Calls (brief, purpose, lever, template, brand check) with their own templates.

Articles to posts

- Input: an article link or text. The agent pulls out the strongest idea, 3 to 5 key points and one quotable line.
- Output: an editorial carousel (cover headline + key points + read-more slide), a quote card and a 20 to 30 second reel script.
- Psychology: posts that teach or explain get saved, so the agent writes them as takeaways people want to keep, not summaries.

Artist features

- Clean and image-led: full-bleed artwork on Paper, with small type, the credit line and a quiet brand mark. No colour blocks over the art.
- Structure: 1. artwork, 2. artist portrait or studio shot, 3. 2 to 3 more works, 4. a quote from the artist, 5. credit + where to see more.
- The agent writes from the artist's own words and submitted bio only. The artist's consent and image rights are tracked as a required checkbox before scheduling.
- Shareability: tag the artist and design a story version they can repost.

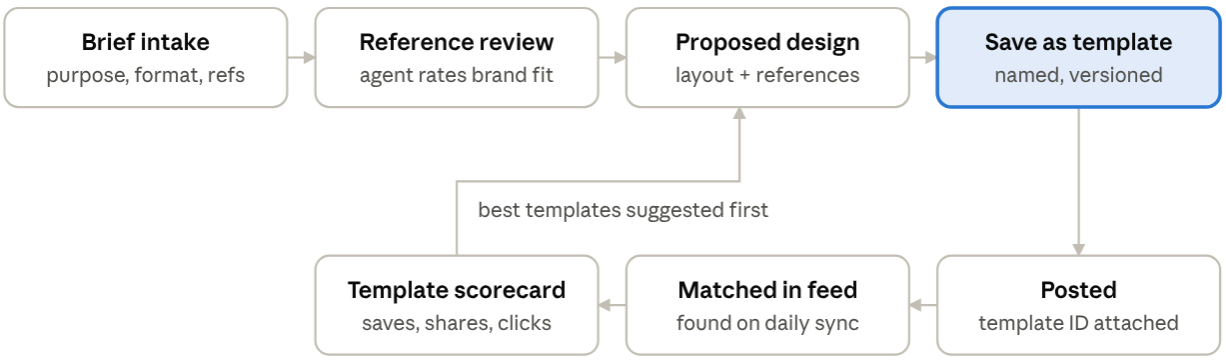

Engagement posts

- Questions, this-or-that, prompts ("show us your studio"), community reposts, behind the scenes.
- They fill quiet days between calls, warm up the audience before a launch and bring in comments the algorithm rewards.
- They use a lighter version of the templates (more Paper, one accent colour) so they don't compete with call posts in the grid.

Post Studio: from brief to reusable template

Post Studio is where any new post starts. The agent asks what the post is and why it exists, reviews your reference images against the brand, proposes a structure, and lets you save the result as a template. When that template appears in the feed, the agent finds it there and reports how it performed.

Every saved template is tracked back from the feed

Post Studio loop · brief to template to performance

Each template that performs well gets suggested first next time. That way the system gets more consistent and more effective with every post.

1. Brief intake: what the agent asks

Question	Examples / options	Required
What is this post?	Open call, article, artist feature, engagement, personal or behind the scenes, announcement	Yes
Details	Title, key facts, dates, prizes, links, names	Yes
What it's for	Awareness, entries, trust, saves, comments, community. Plus the one CTA	Yes
Format	Single post, carousel (number of slides), reel cover, story	Yes
Artworks	Uploads + artist, title, medium, year + consent to feature	If art is shown
Personal or team photos	Studio, events, founder, behind the scenes	Optional
Reference images	Uploads or links, with a note on what you like in each	Optional
Context	Linked call or article, audience, posting date, anything to avoid	Optional

The agent only follows up on missing required facts. It never fills those gaps with guesses.

2. Reference image review

For every reference you upload, the agent writes a short critique:

- **What to take:** layout, crop, type hierarchy, white space, colour proportions, image-to-text ratio.
- **What clashes with ATH:** e.g. script font, gradient behind body text, text over the artwork, too many colours.
- **How it translates:** the same idea rebuilt with ATH's palette, type and grid.
- **Brand fit score:** 1 to 10, so you can see at a glance which references suit us.

3. Proposed design

The agent returns a buildable brief, not just ideas:

- **Structure:** slide-by-slide (or a single layout) with the job of each slide.
- **Wireframe:** where the image, title, body, CTA and logo sit, plus the crop ratio (e.g. 4:5).
- **Design details:** colour pairing, type sizes, grid, spacing, artwork share of the frame.

- **Copy draft:** headline, slide text, caption, hashtags.
- **2 to 3 references:** chosen from your uploads and from ATH's best-performing past posts, each with the reason it was picked.
- **Features it can add:** e.g. a countdown slide, a save-this checklist, an artist quote card, a story repost version.
- **Brand check score** before anything is built. Then one click generates the draft in Canva or Figma.

4. Save as template

Any approved design can be saved to the **Templates** library with a name, content type, editable slots (image, title, body, CTA), locked brand rules and the reasoning behind it. Templates are versioned, so an improved version doesn't break the history of the old one.

5. Recognising templates in the feed

- Posts made in Post Studio carry their template ID, which gets linked to the Instagram post ID when it's published.
- For posts published by hand, the daily sync matches the live post to the approved draft by image and caption. If the match is uncertain, the agent asks someone to confirm.
- Posts made outside the system are scored too, and flagged if they're off-brand.

Template scorecard: times used, average reach, saves and shares per 1,000 reach, link clicks, average brand score and trend. The agent labels each template **keep**, **refresh** or **retire**.

6. Brand Health dashboard

A live view of where the brand is heading:

- **Feed consistency score:** the last 9 and last 30 posts, scored against the kit, with the trend week by week.
- **Per-post brand score** for every live post, including ones made outside the agent.
- **Template adoption:** the share of posts built from templates.
- **Off-brand flags:** what broke, how often and in which content type.
- **Performance by template and by content type,** so taste and results are judged together.

Feed planning and communication strategy

The agent plans the feed as one editorial page. Before anything is scheduled, it checks the grid as a whole, the content mix and the messages that go with it.

Grid rules

- Preview the next 9 to 12 posts in a 3-column grid, alongside the 9 already live.
- Alternate busy and quiet posts: a colour-block call post sits next to image-led features or Paper-based posts.
- Never put two colour-block posts from different calls next to each other.
- Reels covers use the same title system so they sit cleanly in the grid.

Starting content mix (tuned later from Insights)

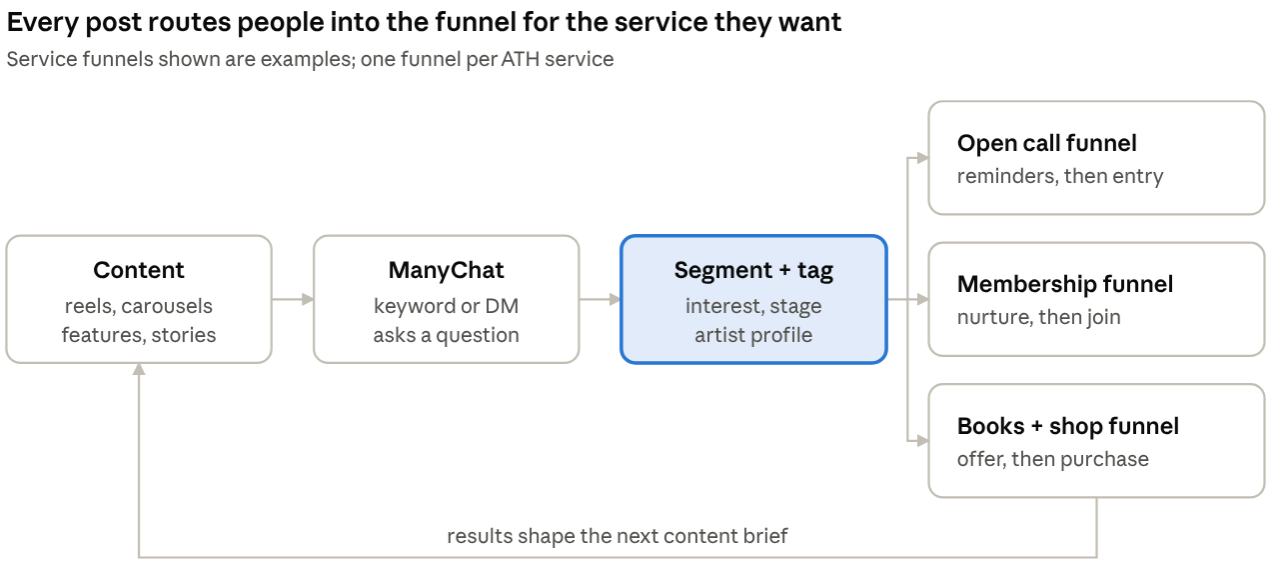

Content type	Share of feed posts	Main goal
Open calls	~35%	Entries
Artist features	~30%	Trust, shares, community
Articles and education	~20%	Saves, authority
Engagement posts	~15%	Comments, reach

Communication map: the planner tags each week with what the audience needs to hear ("a new call is open", "look who we champion", "here's how to get selected") so no single message gets repeated until people tune out.

Cadence: the agent proposes a weekly rhythm (for example 4 feed posts + daily stories) and fits each open call's sequence into it automatically, moving other content around call deadlines.

Strategy engine: content, funnels, leads and coaching

The agent is the senior strategist the team doesn't have. It decides what content to make and why, moves people from a post into the right service funnel, runs the logic behind ManyChat, and gives every team member a ready brief and prompt so the work lands without senior skills in the room.

lead funnel · content to ManyChat to segmented service funnels

Every service ATH offers gets its own funnel. Content creates interest, ManyChat captures and qualifies the lead, and tags send each person into the funnel that matches what they want.

1. Content strategy: day to day, month to month

The agent balances four kinds of content and moves people through them:

Content job	What it looks like	What it does
Professional	Editorial carousels, juror and curator pieces, articles, results	Authority and trust. Makes ATH the place serious artists apply
Real	Behind the scenes, founder voice, studio visits, team moments	Relatability. Makes people like the people behind ATH
Engagement	Trends, questions, polls, this-or-that, community reposts	Reach and comments. Grows the top of the funnel
Conversion	Open call launches, deadlines, offers, keyword CTAs	Leads, entries and sales

- **Daily rhythm:** a "today" plan per account (feed, stories, reels, replies) tied to the month's goals and the live deadlines.
- **Content moves:** one strong idea becomes a reel, a carousel, a story set, an email and a Pinterest pin. The agent plans the cut-downs, so nothing is made once and forgotten.

2. Gen Z virality, luxury polish

- **Trend radar:** the agent tracks rising formats, hooks, sounds and memes in art and creator culture, and keeps a weekly shortlist.
- **Brand filter:** every trend gets checked with "does this fit ATH?" If it does, it's rebuilt in ATH type, colour and tone, so it's fast and native but never cheap.
- **Hook library:** tested first lines and first frames, scored by watch time and saves, and reused in briefs.
- **Reel scripts:** hook in the first 1 to 2 seconds, shot list, on-screen text, caption and CTA, written for the reels maker to shoot.

3. Funnels for every service

Each service gets a **Funnel** record in the Knowledge Hub that the agent designs and maintains:

Funnel part	Example (open call)
Entry content	Launch reel + carousel
Lead magnet	"Comment APPLY for the full brief and a checklist"
ManyChat keyword and questions	APPLY, then "What medium do you work in?" and "First open call with us?"
Tags and segment	interest: open-call · stage: warm · medium: painting
Nurture	DM reminder at 30 days, 7 days and 48 hours, plus a launch email sequence
Conversion	Entry submitted
After	Thank you, then results, then the next call or membership offer

4. ManyChat and lead segmentation

- **Keywords per post:** each conversion post gets a unique keyword, so leads can be traced to the exact post, template and account.
- **Qualifying questions:** one or two short questions in the DM to tag interest, artist level, medium and location.
- **Segments:** by service interest, funnel stage (cold, warm, hot, customer), artist profile and source account.

- **Flows the agent writes:** welcome, qualify, deliver, remind, convert, win back. The copy is ready to paste, and the agent includes a flow diagram for whoever builds it in ManyChat.
- **Re-engagement:** finds cold segments and proposes broadcasts and content to warm them up, within Instagram's messaging rules.
- **Maturity path:** starts with simple keyword-to-link flows, then adds questions and tags, then multi-step nurture tied to email.

5. Strategy room: coaching the team

Because the team doesn't have senior strategy, design or copy skills, the agent coaches as it goes:

- **Weekly strategy memo:** what's working, what to change, priorities for the week, explained in plain words.
- **Role briefs:** the designer gets layout specs and references, the poster gets copy, timing and replies to handle, the reels maker gets a script and shot list.
- **Prompt library:** ready-made prompts the team can use with the agent ("Turn this article into a carousel", "Write 5 hooks for this artwork", "Build a ManyChat flow for this offer").
- **Why, every time:** each task says what it's for and how success will be measured, so the team builds judgment, not just output.
- **Review and feedback:** the agent scores drafts and explains what to fix and why, the way a creative director would.

Instagram data and insights

The agent pulls ATH's full Instagram history and keeps it updated, so every brief starts from what has actually worked. This is what makes it the head of the team and not just a template tool.

What it pulls (through the official Instagram Graph API on each of ATH's 15 to 20 Business accounts)

- Every post, carousel and reel: media, caption, hashtags, posting time and format.
- Per-post numbers: reach, views, likes, comments, saves, shares, profile visits, follows and reel watch metrics.
- Comment text and replies, for sentiment, recurring questions ("is it free?", "can students apply?") and objections.
- Account level: follower growth, audience demographics and active hours.

- Downstream: entry link clicks (UTM-tagged per post) and submissions per call from the entry platform. Without this, we can't connect a post to entries.

What it does with the data

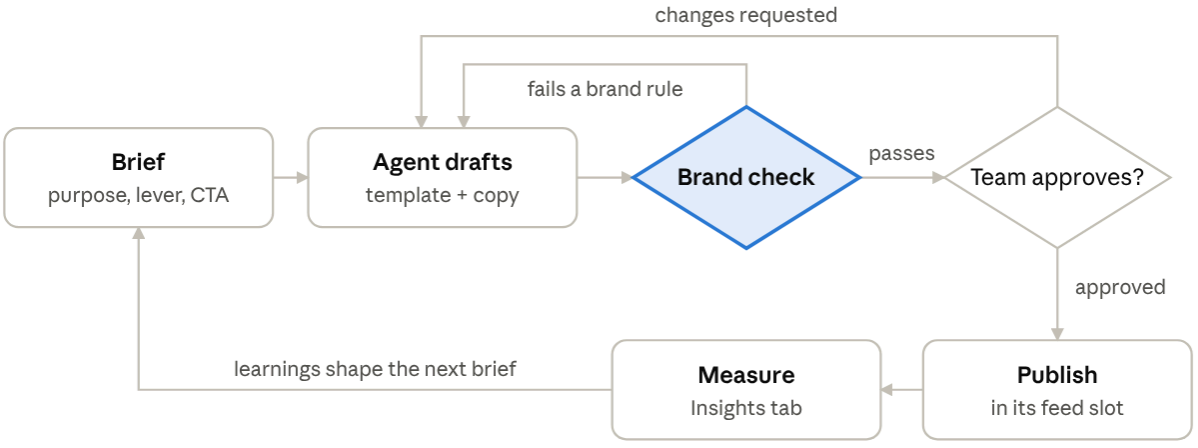

1. **Tags every post** by type, call, stage, lever, colour block, template and hook, so results can be compared fairly.
2. **Finds patterns:** which hooks, colours, formats and posting times drive saves, shares and entries. Results are shown per stage, because a launch and a final-week post have different jobs.
3. **Writes a weekly creative review:** what worked, what didn't, what to change in next week's briefs, plus questions from comments that a future post should answer.
4. **Does open call post-mortems:** entries over time against each post, cost per entry if ads ran, and recommendations for the next call.
5. **Answers questions in plain words**, like "Why did the Women in Arts launch outperform?"

Constraints: Meta's API needs a Business or Creator account linked to a Facebook Page and an approved app. Some metrics only cover recent periods, so the agent stores a snapshot every day to build its own long-term history. Competitor accounts are limited to public data.

Quality gates and workflow

Every asset goes through two gates: the agent's own brand and strategy check, then a person's sign-off. The results feed back into the next brief.

Nothing ships without the brand check and a team sign-off

content workflow · 2 gates, 2 loops back to the draft

A draft that breaks a rule goes back to the agent automatically. Only drafts that pass reach the team.

Brand check (scored by the agent, shown on the card)

- **Brand fidelity:** palette, pairings, type scale, logo position, spacing grid. All must pass.
- **Art first:** the artwork's share of the frame, no text over the work, credit present.
- **Clarity:** one idea and one CTA, and the title readable in under 2 seconds at grid size.
- **Facts:** every date, prize, fee and name matches the approved call brief.
- **Strategy fit:** the stated job, lever and audience match the copy and layout.
- **Feed fit:** no clash with the posts next to it in the grid.
- **Shareability:** a save or share reason is present (checklist, dates, story, takeaway).

Statuses: Draft → In review → Changes requested → Approved → Scheduled → Live → Reviewed.

Success metrics

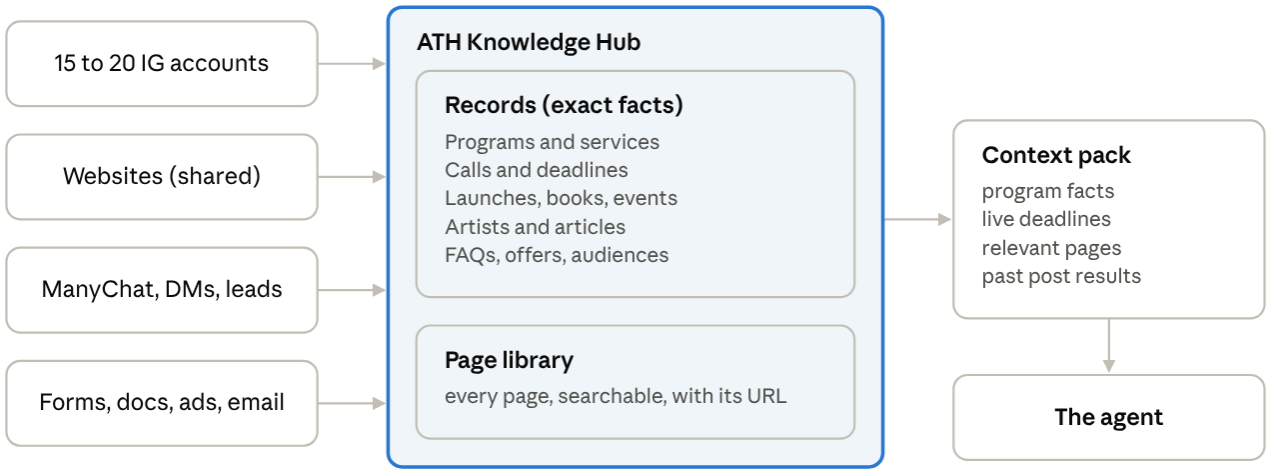

Success means more entries per open call from a feed that looks like one brand, with less back-and-forth for the team. Baselines come from the first Insights pull. The targets below are placeholders to confirm once we have that baseline.

Metric	Measures	Target (to confirm)
Entries per open call	Conversion	+25% vs. last 3 calls' average
Entry link clicks per 1,000 reach	Conversion	+30%
Saves + shares per 1,000 reach	Shareability	+40% on carousels
Brand check pass rate on first draft	Cohesion	⩾ 80% by month 3
Posts published that skipped the agent	Cohesion	0 for open calls
Time from call brief to full approved sequence	Team efficiency	⩽ 2 working days
Rounds of revision per post	Team efficiency	⩽ 1.5 average
Follower growth during an open call	Awareness	Tracked; no target in v1

Knowledge Hub: how the agent knows ATH

The agent never works from memory. Everything it knows about ATH lives in one Knowledge Hub, in two parts. **Records** hold the facts that have to be exact: programs, deadlines, fees, launches. The **page library** holds every post caption, web page and key document so the agent can search them. Before each brief, the agent pulls a context pack from the hub.

Every brief starts from a context pack pulled from one Knowledge Hub

Knowledge Hub · 4 sources, 1 hub, a context pack per brief

Records are the source of truth for facts. Pages and documents give the agent background and ATH's own wording.

What goes in: the records

Record	What it holds	Fed by	Linked to
Programs and services	Name, what it is, who it's for, fee or price, page URL, status, owner, assigned colour pairing	Dashboard form, first filled in from the website	Calls, launches, posts, pages
Calls and deadlines	Open, close and results dates, prizes, jurors, eligibility, entry link	Open Calls tab	Program, posts, entries
Launches	New programs, books, products: launch date, offer, key messages, assets	"Add launch" form	Program, posts

Record	What it holds	Fed by	Linked to
Events and dates	Podcast episodes, exhibitions, talks, awareness days, holidays	Form or calendar sync	Posts, Feed Planner
Artists	Bio, works, credits, consent, links	Artist Features, call winners	Features, calls
Articles	Link, summary, key points	Articles tab or website sync	Posts, programs
FAQs and objections	Common questions and doubts, with approved answers	Website FAQ + questions pulled from comments	Programs, captions
Audiences	Who we speak to (emerging artists, collectors, partners) and what each needs to hear	Workshop, then Insights	Briefs, programs

Brand Kit, templates, posts and metrics are already covered in the sections above. They live in the same database, so every post can be traced to a program, a call or a launch, and to a template.

Programs to load first (to confirm): Open Call for Artists, Women in Arts Network, the podcast, the books, My Studio, the Substack, plus any paid services or memberships.

Channels and accounts: Instagram first

ATH runs 15 to 20 Instagram accounts. Each one gets an **Account** record in the hub, so the agent knows what every account is for before it plans or designs anything for it.

Account field	What it holds
Handle and role	e.g. the main ATH account, an open call account, Women in Arts Network. What each one exists to do
Audience	Who follows it and what they need to hear
Programs it promotes	Linked program records, so a new call goes to the right accounts
Brand variant	Which kit pairing or sub-brand rules apply. Every account still sits inside the ATH system

Account field	What it holds
Cadence and owner	Posts per week, stories, who approves and who posts
Connection	API access for that account (Business or Creator, linked to a Facebook Page)

How the accounts work together

1. **Connect each account once.** The agent pulls every post, reel, caption, comment and metric for each one and syncs daily, as described under Instagram data and insights.
2. **Plan per account and across the network.** The Feed Planner shows each account's grid and a network calendar, so one launch gets coordinated across accounts instead of duplicated.
3. **Cross-promotion rules.** For each launch the agent decides which account leads, which ones use Instagram Collab posts or reshare to stories, and which stay quiet, so followers of several accounts don't see the same post five times.
4. **Compare accounts.** Insights and Brand Health report per account and network-wide, showing which accounts convert, which are drifting off-brand and which are under-posting.

Later channels plug into the same hub: Substack, Pinterest and email (Flodesk), then the website. Each new channel becomes another set of Account records with its own formats and templates, and reuses the same programs, deadlines, brand kit and context pack. V1 builds Instagram only.

Websites: one site, many accounts

Websites are records of their own, linked **many to many** with accounts. One website can be the source for several Instagram accounts, and one account can point to more than one site.

- **Website record:** domain, owner, which programs it covers, which accounts use it, sync schedule.
- **Sync:** the agent reads the sitemap, splits every page into searchable passages with their URLs and re-syncs weekly (or on "Sync now"). Each page is tagged to a program, and a person confirms that once.
- **Shared, not copied:** a page is stored once and reused by every account linked to it, so a fix on the site updates the context for all of them.
- **Conflicts get flagged:** if a page and a record disagree (for example, two deadlines), the agent flags it and won't post either version until someone fixes it.

- **Documents too:** program decks, book briefs, media kits and partner documents link from Drive or Notion in the same way.

Leads, messages and performance signals

Beyond posts, the agent picks up every signal that shows what people do after they see a post:

Source	What the agent picks up	Used for
ManyChat	Keyword triggers (e.g. "comment APPLY"), DM flows, subscribers, tags, links clicked inside the flow	Which posts start conversations, which keywords convert, CTA wording
Instagram DMs and comments	Message volume per post, common questions, sentiment, objections	FAQs, next posts that answer doubts, tone
Leads	New leads by source, account and post (from ManyChat, forms, link in bio)	Lead cost and quality per post and per template
Email (Flodesk)	Sign-ups by source, open and click rates for launch emails	Matching posts with emails, full-funnel view
Entry platform	Submissions per day, per UTM source	Real conversion per post
Meta Ads	Paid reach, spend, results for boosted posts	Separating organic results from paid ones
Website analytics	Visits and conversions from Instagram traffic	Which posts drive site visits

Core rates the agent tracks per post, template, account and campaign

- **Engagement rate:** (likes + comments + saves + shares) ÷ reach.
- **Organic vs. paid:** reach and results split, so boosted posts don't inflate how well a design looks.
- **Conversation rate:** DMs and keyword triggers ÷ reach.
- **Lead rate and entry rate:** leads or entries ÷ link clicks, and ÷ reach.
- **Follower growth** per account during each campaign.

Every signal is tied back to the post, template, account and program it came from. That way the agent can say, for example, "the juror carousel on the open call account started 3x more DMs than the prize carousel" and adjust the next brief.

How the agent uses it: the context pack

For every brief, plan or review, the agent pulls:

- The program record, plus the call or launch it's linked to.
- Every live deadline in the next 90 days, so posts don't clash and sequences fit around each other.
- The 3 to 5 most relevant passages from pages and documents.
- FAQs and objections for that program.
- Past posts for that program and how they performed.
- The Brand Kit and the best template for the job.

The pack appears on the card as **Sources used**, so anyone can check where a fact came from.

Planning from the hub

- **Master calendar:** every deadline, launch and event in the hub appears on the calendar automatically.
- **Auto-reserved slots:** adding a new call or launch reserves its post sequence in the Feed Planner (e.g. launch, 30-day reminders, final week).
- **Proposals for new items:** when someone adds a program, book or launch, the agent proposes a content plan for it the same day.
- **Weekly look-ahead:** what's coming in the next 6 weeks and what needs to be made for it.

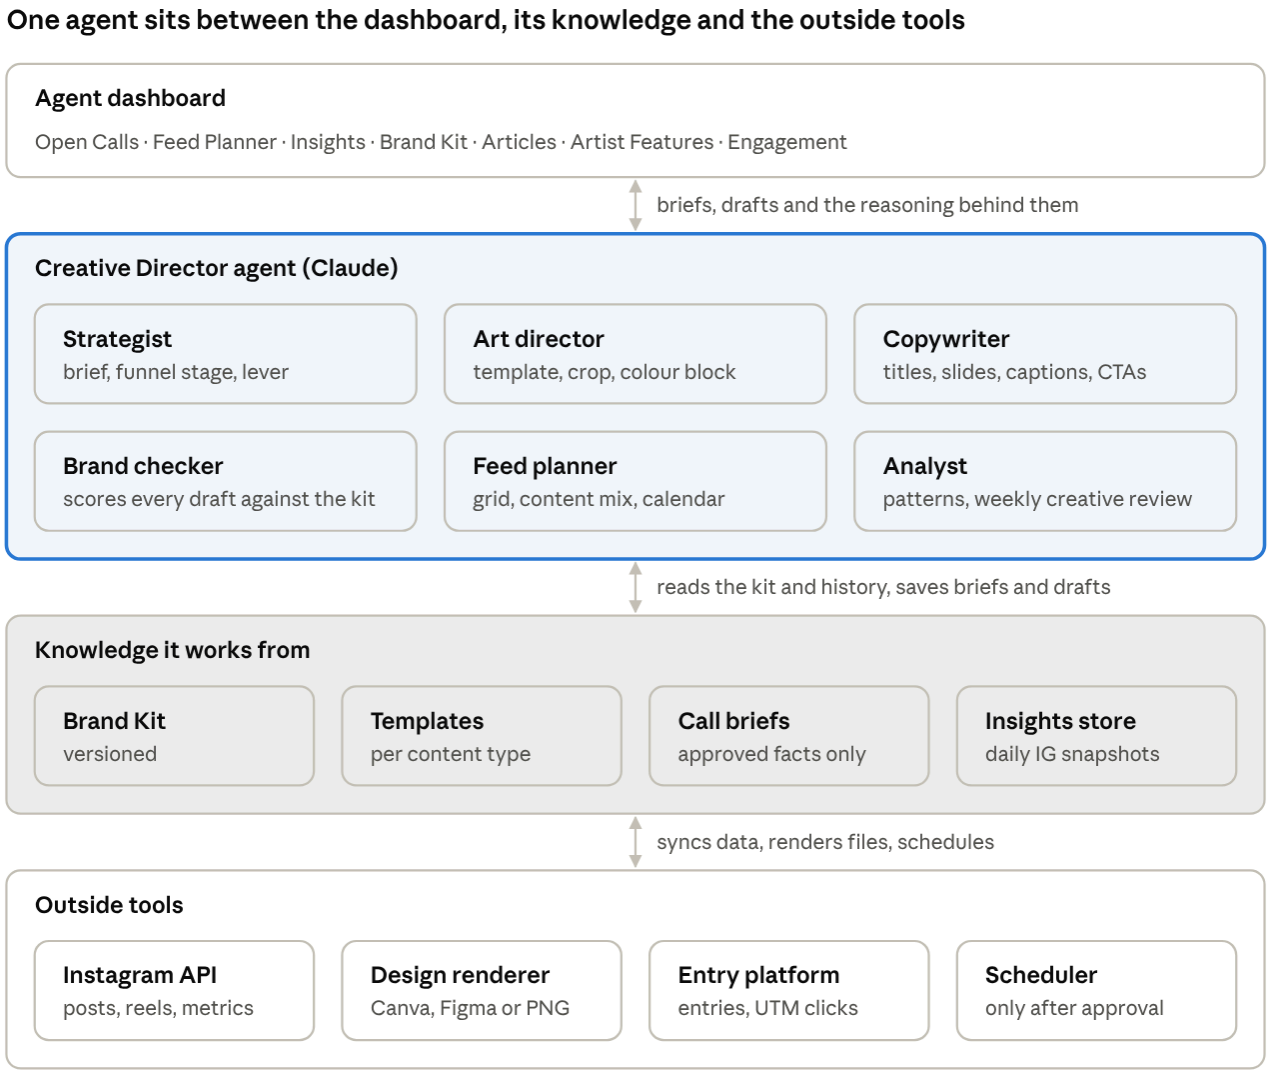

Keeping it current

- **Add to Hub** button with short forms: Program, Call, Launch, Event, Artist, Article. Each takes about 2 minutes.
- Every record has an owner and a "last verified" date. The agent reminds the owner after 60 days, or when a date has passed.
- Finished programs are archived. They stay in the history for learning, but the agent stops promoting them.

Build note: one database (e.g. Postgres) holds the records and links. A search index over the same database (e.g. pgvector) holds the page library, so facts and pages can be queried together.

Technical architecture

One Claude-based agent with six specialised skills sits between the dashboard, a knowledge layer it always reads from, and the outside tools it syncs with.

system architecture · 4 layers

The agent never designs freehand. It fills **locked templates** (Canva brand templates or Figma components built from the Brand Kit), so cohesion is guaranteed by the system rather than by taste on the day.

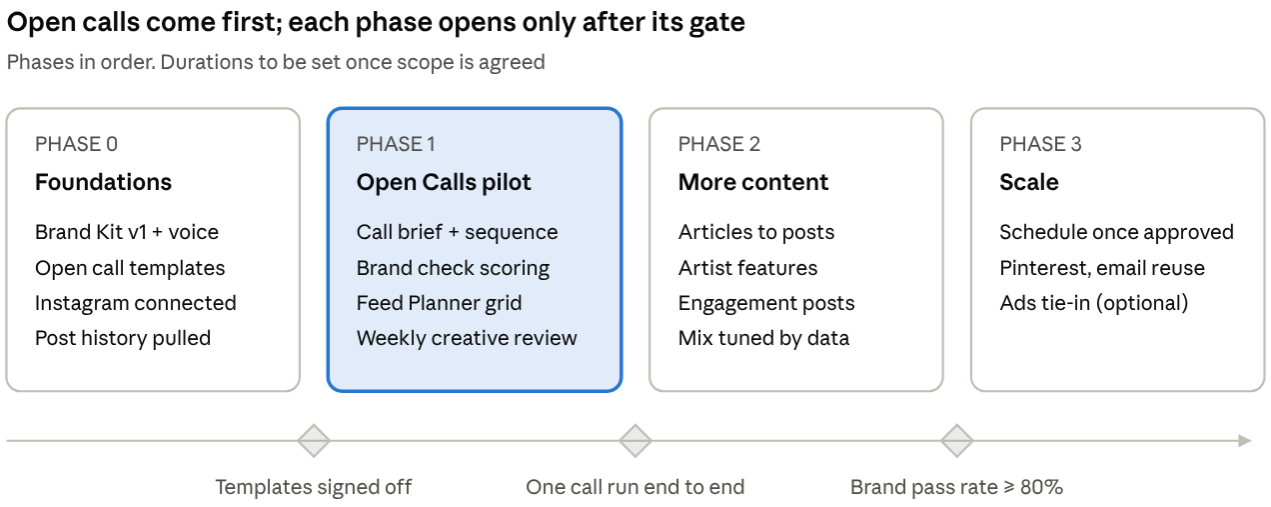

Key build choices

- **Model:** the latest Claude model for reasoning, copy and brand review (it also reads images, so it can judge drafts and past posts visually).
- **Templates first:** build the open call template family in Canva or Figma first, then let the agent autofill text, artwork and colour block through the API.
- **Data:** a small database (posts, metrics snapshots, comments, calls, briefs, assets) synced daily from the Instagram Graph API.

- **Human-in-the-loop:** nothing gets scheduled without an approval click. Every action is logged.

Phased roadmap

Start with open calls, because that's where inconsistency costs entries. Prove the system on one live call, then extend it to the other content types.

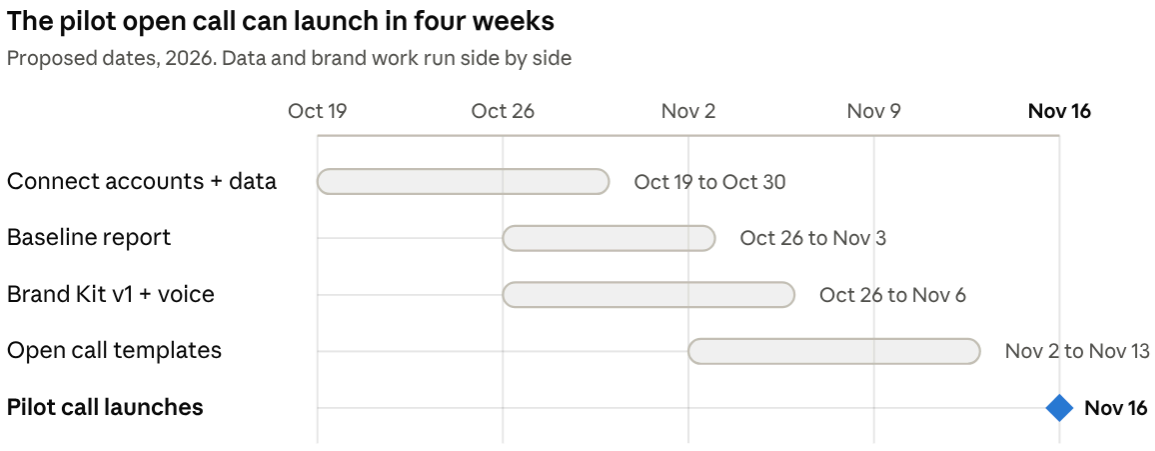

roadmap · 4 phases, 3 gates

The Phase 1 pilot runs on the next open call, from launch to winners, so we can compare entries and saves against past calls.

Next 30 days

Test the system on a real open call before building the full dashboard. Three steps, in order:

next 30 days · proposed timeline

1. **Get the numbers and inputs flowing.** Connect every Instagram account, ManyChat and the entry platform, then build a starting report per account from the last 12 months. "Outperforming" only means something against a starting number. Setup steps are in the next section.
2. **Lock the brand into templates.** Finish Brand Kit v1 (colour pairings, the font licence decision, the voice guide, logos when final) and build the open call template set (launch, 30-day reminder, countdown, closed, winners) in Canva or Figma. Templates fix the inconsistent look even before any software exists.
3. **Pilot the next open call end to end.** Run the full sequence with the agent's playbook: a brief, a colour pairing, a unique comment keyword per post, and the brand check before each post. Compare entries, saves and DMs with the last three calls, then build the dashboard MVP around what worked.

Templates: decided: Figma as the master library, plus Canva copies for the team. Claude builds it (see Build plan).

Step 1 setup: connecting the data

Four accounts are already readable through the Meta connector via the **Arts To hearts Project (New website)** ad account: @artstoheartsproject, @opencallforartists_, @womeninartsnetwork and @risingartistsnetwork_. That connection returns each post's caption, format, date, likes, comments and link. It doesn't return reach, saves, shares or DMs.

A. Right now (no setup): pull every post from those four accounts into a starting report: how often each posts and in which formats, top and bottom 10 posts, likes and comments per post, best days and times, and how comment keyword posts perform.

B. Connect the remaining accounts (founder, about 1 hour)

- [ ] List every account in a sheet: handle, what it's for, who manages it.
- [ ] Make each a professional (Business) account: Instagram → Settings → Account type and tools → Switch to professional.
- [ ] Add each one to the **Arts To Hearts Project** business account in Meta Business Suite (Settings → Accounts → Instagram accounts → Add).
- [ ] Give each one to the "Arts To hearts Project (New website)" ad account, so the current connector can read it.

C. Unlock reach, saves, shares and comment text (developer, about half a day)

- [ ] developers.facebook.com → Create app → Business, linked to the ATH business account.

- [ ] Add the Instagram product with `instagram_basic`, `instagram_manage_insights`, `instagram_manage_comments`, `pages_show_list`, `pages_read_engagement` and `business_management`. If only ATH's own team uses the app, Meta's app review shouldn't be needed. Check Meta's current rules at setup.
- [ ] In business settings, create a system user "ATH Agent", give it every account and Page, and generate a token.
- [ ] Store the token as a secret in the build environment. Never paste it into chat or documents.
- [ ] Write a daily sync job that saves posts and their numbers to the database.

D. Connect what happens after the post

- [ ] **ManyChat:** export subscribers with their tags and keyword stats as a CSV now. Add the Pro plan API key as a secret later.
- [ ] **Entry platform:** export submissions as a CSV (date, which call, how they found us).
- [ ] **Tracking tags on every entry link from now on:** `?utm_source=instagram&utm_medium=social&utm_campaign=<call>&utm_content=<account>-<post>`
- [ ] **Flodesk and Shopify:** already connected. Pull email sign-ups and book or shop sales.

Quick fix found during setup: @opencallforartists_ uses the same comment keyword ("111") on many posts, so leads can't be traced to a post. Give every conversion post its own keyword (like the "FLOWER" post did).

Build plan: Claude builds it

Claude builds the system: the app, the database, the data sync, the agent and the template libraries. The founder is the product owner, approving each sprint. People supply access and approvals. Claude does the build work.

Templates in both Figma and Canva

	Figma	Canva
Who uses it	Designers	The wider team (poster, reels maker, quick edits)
Role	**Master library.** Design tokens, components, every template and its variants	**Team copies** of the most-used templates, locked to the brand kit

	Figma	Canva
What lives there	Full open call family, artist features, articles, reels covers, the dashboard UI	Launch, reminder, countdown, winner, artist feature, quote card, story set
Editing	Designers change the master	Team edits text and images only, with brand elements locked

Sync rules

- Figma is the source of truth. When the Brand Kit or a template changes there, Claude regenerates the Canva copies.
- Every template has **one ID** shared by its Figma and Canva versions, so performance tracking works whichever tool made the post.
- The brand check runs on the exported image, so a post is checked the same way whether it came from Figma, Canva or the agent.
- To confirm: Canva's API autofill (filling templates automatically) may need a Canva Enterprise plan. Without it, the team fills Canva templates by hand from the agent's copy.

Sprints

Each sprint ends with a demo and a founder sign-off.

1. **Foundations:** repo, database, Google sign-in with roles, the Brand Kit as design tokens. Done when the team can log in and see their role's view.
2. **Data:** connect the Instagram accounts, ManyChat CSV import, entry CSV import, daily sync, baseline report. Done when the starting report shows every connected account.
3. **Template libraries:** the Figma master library (tokens, components, open call family), then the Canva team copies and the shared template IDs. Done when the designer and the team can each make a launch carousel on-brand in under 30 minutes.
4. **Open Calls MVP:** call brief, post sequence generator, copy, brand check, approval flow, unique comment keyword per post. Done when the pilot call's full sequence is drafted and approved in the system.
5. **Today view and Insights MVP:** home screen tiles, tasks with buttons, entries goal bar, per-post results. Done when the pilot call is tracked live from launch.

What people provide

- [ ] Access added as secrets in the build environment: Meta system user token, ManyChat API key, Canva and Figma access, hosting.

- [ ] The list of Instagram accounts and services.
- [ ] Brand decisions: colour pairings per call type, the font licence, voice sign-off, final logos.
- [ ] Sign-off at the end of each sprint.

The build prompt to give Claude

```
Build the ATH Creative Director Agent described in
docs/ATH_Creative_Director_Agent_PRD.md (live version:
https://claude.ai/code/artifact/f8524439-d613-48c0-8e9e-f45731fdcc3f).

Rules:
- Follow the Build plan sprints in order. Start with Sprint 1 and stop for my
sign-off at the end of each sprint with a demo and a short summary.
- Phase 1 scope is only: call brief, open call sequence, brand check,
approvals, Today view, basic Insights, data sync. Everything else waits.
- Use the ATH brand from the repo (app/css/studio.css tokens, design/DESIGN-
NOTES.md). The dashboard must be visual first, on-brand and phone-friendly.
- Templates: Figma is the master library for designers; make Canva team
copies of the core open call templates. One template ID shared across both.
- Never invent facts (dates, prizes, fees, names). Only use approved records.
- Never post or schedule anything without a human approval.
- Keep all keys and tokens as environment secrets, never in code or chat.
- Commit to a feature branch and open a pull request per sprint.

Before writing code, list what access or decisions you are missing and ask me
for them.
```

Gap analysis: what this PRD still misses

The PRD is strong on vision, brand, content and data. It's weak on the things that decide whether it ships: scope, owner, budget, how we test the agent, and risk. Fix the top five before any build starts.

#	Gap	Why it matters	Fix
1	**Phase 1 is too big**	Seven Phase 1 tabs is months of build. The pilot only needs a few	Cut the MVP to the call brief, the Open Calls sequence, the brand check and a basic Insights view. Move Templates scoring, Brand Health and gamification to Phase 2

#	Gap	Why it matters	Fix
2	**No owner, builder or budget**	Builder decided: Claude, with the founder as product owner (see Build plan). Budget and running costs still need an estimate	Name a product owner and a builder (in-house developer, freelancer or agency). Estimate costs: build hours, AI usage, database, Canva or Figma, ManyChat Pro
3	**No way to test the agent's quality**	Without a test, nobody knows if its briefs and copy are good enough to trust	Build a test set of about 50 past posts with known results. Score the agent's critiques and copy against them each release, plus a monthly blind review by the founder
4	**Risks aren't listed**	One ATH ad account is already flagged for unusual activity. API changes, account bans and wrong facts can stop the system	Add a risk register: Meta API changes, account restrictions, the AI getting a deadline or prize wrong, team not adopting it, ManyChat policy limits. Each with an owner and a fallback
5	**Revenue isn't a goal**	Funnels exist, but no money targets per service	Add revenue and lead targets per service (entries × fee, memberships, book sales) and show them on the founder view
6	**Privacy and consent for lead data**	ManyChat, DMs and email hold personal data from artists worldwide	Add a data policy: what's stored, for how long, who can see it, consent wording in DM flows, and how to delete someone's data on request
7	**Reels and stories have no system**	Reels drive most reach, but there's only a script format	Add a reels and stories template set: cover style, on-screen type, motion rules, caption style, length per job

#	Gap	Why it matters	Fix
8	**Per-account identity is undefined**	15 to 20 accounts need to feel related but distinct	Define the brand architecture: a master brand, sub-brand rules, and one colour pairing and voice note per account
9	**Team onboarding and adoption**	A tool the team doesn't use fixes nothing	Add a launch plan: training, a 2-week shadow period, success = 100% of open call posts going through the system
10	**Accessibility**	Alt text, captions and contrast affect reach and inclusion	Add to the brand check: alt text on every post, captions on every reel, contrast checked on colour pairings
11	**Paid boost strategy**	Organic and paid are tracked, but there's no plan for when to boost	Add a simple boost rule, e.g. boost the launch and final week posts once they beat the account's average saves rate
12	**Benchmarks against peers**	"Outperforming" needs a reference point outside ATH	Track 5 to 10 comparable open call accounts from public data and compare formats and cadence monthly
13	**Reliability**	Sync failures, expired tokens and backups aren't covered	Add alerts when a sync fails, a token about to expire, daily backups and an audit log
14	**Document order**	Sections jumped around as the PRD grew	Reorder into Why → Who → What → How → When before sharing it widely

Items 1 to 5 block the build. Items 6 to 10 are needed before launch. Items 11 to 14 can follow in Phase 2.

Open questions and decisions needed

- [ ] **Logos:** when are the new logos final, and do we need a separate mark for open calls (e.g. a series seal)?
- [ ] **Fonts:** license Nord and Proxima Nova for social use, or choose approved alternatives?
- [ ] **Colour pairings:** which pairings from the v24 guide are approved for open call colour blocks? Is there one per call type (e.g. Women in Arts always uses the same pairing)?
- [ ] **Voice:** who signs off the ATH voice guide the agent writes in?
- [ ] **Design tool:** decided: both. Figma is the master library for designers, and Canva holds locked copies for the team (see Build plan). Still to confirm: whether the Canva plan supports API autofill.
- [ ] **Instagram access:** confirm that ATH's account is a Business account linked to a Facebook Page, and who owns the Meta app approval.
- [ ] **Entry tracking:** which platform takes submissions, and can it report entries per day and per UTM source?
- [ ] **Publishing:** should the agent schedule directly (Meta API or a scheduler) once a post is approved, or hand the files to the poster?
- [ ] **Scope of authority:** may the agent reject a draft from the designer, or only flag issues?
- [ ] **Other channels:** should Pinterest, Substack and email (Flodesk) reuse the same assets in Phase 3?
